The similarity solutions in this section are applicable to subsonic, supersonic, and hypersonic conditions. However, for the hypersonic case, viscous dissipation will lead to high-temperature, chemically-reacting flows. In this course, we will highlight only the effects of viscosity and thermal conductivity in combustion with high Mach numbers.

where $\theta = \theta(x)$ is the local surface angle with respect to freestream flow. This $\theta(x)$ is the local "inclination" method for describing surface pressure at x . (Assumes slender bodies) Even though hypersonic flow is inherently non-linear, there are local inclination methods that work. Newtonian Flow Edit. Newton hypothesized (guessed) that the aerodynamic force acting on a flat plate varied ...

Finally, the increased temperature of hypersonic flows mean that real gas effects become important. For this reason, research in hypersonics is often referred to as aerothermodynamics, rather than aerodynamics. The introduction of real gas effects means that more variables are required to describe the full state of a gas.

High Temperature Effect. Hypersonic flow is a high energy flow. The ratio of kinetic energy to the internal energy of the gas increases as the square of the Mach number. When this flow enters a boundary layer, there are high viscous effects due to the friction between air and the high-speed object.
